# caArray Importer 1.0.2

It is a great pleasure to announce the release of the caArray Importer v1.0.2, an open-source package that extends the caArray Java API to provide programmatic access to the following functionality:

- retrieval of imported array designs
- creation, modification and deletion of projects
- upload, validation and import of array data files
- modification of file type
- file removal

This package ([download caarray importer v1.0.2]) was developed by Dr. Matthew Eldridge, Head of the Bioinformatics Core facility at Cancer Research UK's Cambridge Research Institute. This version of the caArray Importer is compatible with the following caArray versions:

- 2.3.0.1
- 2.3.1.1

It is not compatible with caArray version 2.2.1 or earlier releases.

To learn how to use caArray Importer, please follow the instructions in the README.txt included in the package. A knowledgebase article with a step-by-step guide on how to install and use the caArray Importer is available at https://cabig-kc.nci.nih.gov/Molecular/KC/index.php/Caarray054.

Please note that the source and compiled code is provided on an "as-is" basis without any warranty and is distributed under the Apache License, version 2.0 (see separate LICENSE.txt file). The MATKC and Matthew Eldridge will provide limited support on caArray Importer to the community through the MATKC forum. We encourage the community to join us in helping each other.
